Project: Visualizing Housing Market Trends: An Analysis of Sale Prices and Features using Tableau

PS-1

I am: Real Estate Agent

I'm trying to: Understand how house features such as size, bedrooms, bathrooms, location and renovation status influence sale price, so I can advise clients on fair pricing and marketing strategy.

But: Historical sales data is spread across thousands of individual property records with dozens of features, making it difficult to interpret manually.

Because: There is no centralized dashboard that summarizes price trends against house features, location and condition.

Which makes me feel: Frustrated, because pricing recommendations to clients end up based on guesswork rather than data-driven evidence.

PS-2

I am: Housing Market Analyst

I'm trying to: Analyze how sale price varies with house features (bedrooms, bathrooms, living area, lot area, floors, overall grade, age, renovation status, waterfront view) and location, using interactive visualizations.

But: The raw dataset contains over 21,000 property records across 34 fields, which is difficult to explore and interpret without proper visualization tools.

Because: Manual analysis of a dataset this large is time-consuming, and meaningful price-driving patterns are easily missed.

Which makes me feel: Inefficient, because valuable insights about the housing market may be overlooked.

Problem to Solution Flow

Raw Housing Dataset → Data Cleaning & Feature Transformation → Tableau Dashboard & Story → Housing Market Insights → Better Buying, Selling & Pricing Decisions
