

CUSTOMER JOURNEY MAP

Housing Market Analyst — Analytics Dashboard Journey

Project Overview

Project Title	Visualizing Housing Market Trends: An Analysis of Sale Prices and Features using Tableau
Deployment	Published directly to Tableau Public (interactive Dashboard + Story); no custom website
Team Members	Masa Nani (Team Lead) • Gabbi Nithya Sree

Project Description

The project analyses approximately 21,600 residential sale records using Tableau Public. It delivers housing-market insights through an interactive Tableau Dashboard and Tableau Story, published directly on Tableau Public. The dashboard covers the following areas:

- KPI Dashboard (total properties, average sale price, basement area)
- Price & Feature Relationship Analysis (bedrooms, bathrooms, living area, grade)
- Renovation Impact Analysis (sales by years since renovation, age by renovation status)
- House Age Distribution Analysis (by bedrooms, bathrooms and floors)
- Location / Zipcode Price Analysis
- Waterfront & View Premium Analysis
- Interactive Filters

Its objective is to help home buyers, real estate agents, and housing market analysts understand price-driving features and make informed pricing and buying decisions.

Customer Persona

Primary User	Housing Market Analyst
Age	28–40 years
Occupation	Housing / Real Estate Market Analyst
Experience	Analyses property sales data to advise stakeholders on pricing, valuation and market trends.

Goals

- Understand which house features most strongly influence sale price.
- Monitor price trends by location (zipcode group).
- Quantify renovation and waterfront-view price premiums.
- Make data-driven pricing and valuation recommendations.

Challenges

- Large volume of raw property records (~21,600 rows, 34 fields).
- Difficulty identifying price-driving patterns manually.
- Limited visibility into location-based pricing differences.
- Time-consuming manual comparison across listings.

Dashboard Analytics Journey — Five Stages

	Access dashboard	Review KPIs	Analyze features	Review story	Make decisions
Experience steps	Opens the Tableau Public link and loads the housing dashboard.	Scans KPI cards for total properties, average sale price, and basement area.	Filters by zipcode group, bedrooms, bathrooms and price range.	Walks through the guided Tableau Story on renovation, age and bedrooms.	Applies insights to pricing, listing, or renovation-advice decisions.
Interactions	Tableau Public dashboard homepage.	KPI summary cards on the dashboard.	Interactive filters and drill-down charts.	Guided Tableau story, slide by slide.	Team discussions and a shared dashboard link.
Goals and motivations	Get a fast snapshot of overall market scale.	Understand what the KPI numbers mean for the market.	Find which features and locations drive price.	See the big picture, not just individual charts.	Act on pricing/valuation with confidence.
Positive moments	Dashboard loads quickly with a clean layout.	KPI cards make market scale easy to grasp.	Filters reveal patterns not noticed before.	Story ties the numbers into a clear narrative.	Feels confident the recommendation is data-backed.
Negative moments	Unsure where to start among several charts.	KPIs lack context for whether values are high or low.	Too many filter combinations can feel overwhelming.	Story can feel static if not refreshed with new data.	Hesitates to act without a second data point.
Areas of opportunity	Add a short “start here” note or tour panel.	Add benchmark comparisons or trend indicators to KPIs.	Suggest smart default filters based on common queries.	Refresh the story periodically with updated market data.	Add an exportable summary of key insights.

Prepared as part of the Visualizing Housing Market Trends capstone project.
